

NG YI XUAN

Software Engineer

ngngvongng@gmail.com | 011-5955 8003 | [LinkedIn](#) | [GitHub](#) | Teriang, Pahang

OBJECTIVE

Final-year Computer Science student (CGPA 3.51) currently interning as a full-stack developer at Godigital (Ean Label Industry). Skilled in software engineering with Laravel, React, MySQL, Docker, Redis, and AI-assisted workflows. Seeking a Software Engineer role; available full-time from September 2026. Brings 1+ year of hands-on development experience through internship and personal projects.

PROFESSIONAL EXPERIENCE

Web Developer Intern | Godigital – Ean Label Industry | Mar 2026 – Present

- Use GitHub Copilot and Gemini to move faster on routine code, but read through and rework whatever they produce, because it still has to be code the team can maintain.
- Stock counts in the warehouse system had not matched the shelves for years. I traced where the mismatches came from with SQL and cleaned up the historical data until the system reported stock accurately.
- Rebuilt old internal screens as simpler dashboards in React and Nuxt.js, and connected the company ERP to the warehouse system at the database and backend level so the two stopped drifting apart.
- Work in a team of five on the warehouse management system, taking part in how features are designed rather than only building what is handed over.
- Finance had no way to see stock quantity, value, movement or ageing. I proposed a reporting dashboard for them, built it, and the team adopted it.

PROJECTS

Web-Based Python Bootcamp for Beginners | Final Year Project | 2025 – 2026

- Built a full-stack platform that teaches Python to beginners, with lessons, coding exercises, quizzes and gamification. Laravel, React and MySQL, across 264 routes and 68 database migrations.
- Used Bayesian Knowledge Tracing to estimate how well a student knows each concept, updated after every answer. A plain correct-rate treats every question the same, so I weighted it by question type and difficulty.
- Wrote 338 automated tests (PHPUnit, Vitest, Playwright) that run on every push. They caught a double-counting bug that was quietly corrupting the learning-gain figures.
- Used the Gemini API to help draft lessons and tag concepts, and Judge0 to run student Python code in a sandbox so it cannot touch the server.

Playground: Real-Time Multiplayer Game Platform | Side Project | [GitHub Repo](#) | [Live Demo](#) | 2025

- Built a real-time multiplayer game platform (Draw & Guess, Werewolf). Each game is its own module, so adding one does not mean touching the games already there.
- Game state lives on the server, not the browser. In Werewolf the client could otherwise read everyone's roles, so each player only receives what their role is allowed to see. State syncs live over Socket.io.
- Login with JWT plus a guest mode so people can join a room without signing up. PostgreSQL on Supabase in production, with an in-memory fallback so it still runs locally without setting up a database.

Meeting AI Platform | Side Project | [GitHub Repo](#) | 2025

- Upload a meeting recording and it comes back as a transcript, summary and action items. Whisper does the speech-to-text, Gemini turns the transcript into the summary.
- The browser used to poll for progress, which was slow and wasteful, so I switched to pushing updates over WebSocket. Reverb sometimes drops the connection quietly, so a timed check runs alongside it.
- Large audio files were timing out, so uploads are sent in 5 MB chunks with a progress bar. The whole stack runs in Docker, and 62 tests run in CI on every push.

EDUCATION

BSc Computer Science (Hons) – Network Engineering | Universiti Malaysia Sabah | Expected Nov 2026

CGPA: 3.51 | Internship: Mar – Aug 2026 | Available full-time from Sep 2026

Relevant Coursework: Network Programming, Cybersecurity, Web Technology, Cloud Computing, Big Data Analytics, Object-Oriented Programming, System Analysis & Design

TECHNICAL SKILLS

Frontend: HTML5, CSS3, JavaScript, TypeScript, React, Nuxt.js, Inertia.js

Backend: PHP, Laravel, Java, C++, REST API

Database: MySQL, SQL, Redis

Concepts: REST API, WebSocket (Laravel Reverb), Automated Testing

AI Tools: GitHub Copilot, Gemini AI, OpenAI Whisper, Prompt Engineering

Tools: Docker, Git, Figma

Languages: Malay (Native), English (Fluent), Mandarin (Fluent)

CERTIFICATIONS

Huawei HCIA – Datacom & Cloud Computing | CCNA: Enterprise Networking, Security & Automation

CCNA: Switching, Routing & Wireless Essentials | CCNA: Introduction to Networks
